

Transport optimization

Increase the effectiveness and efficiency of your transport network

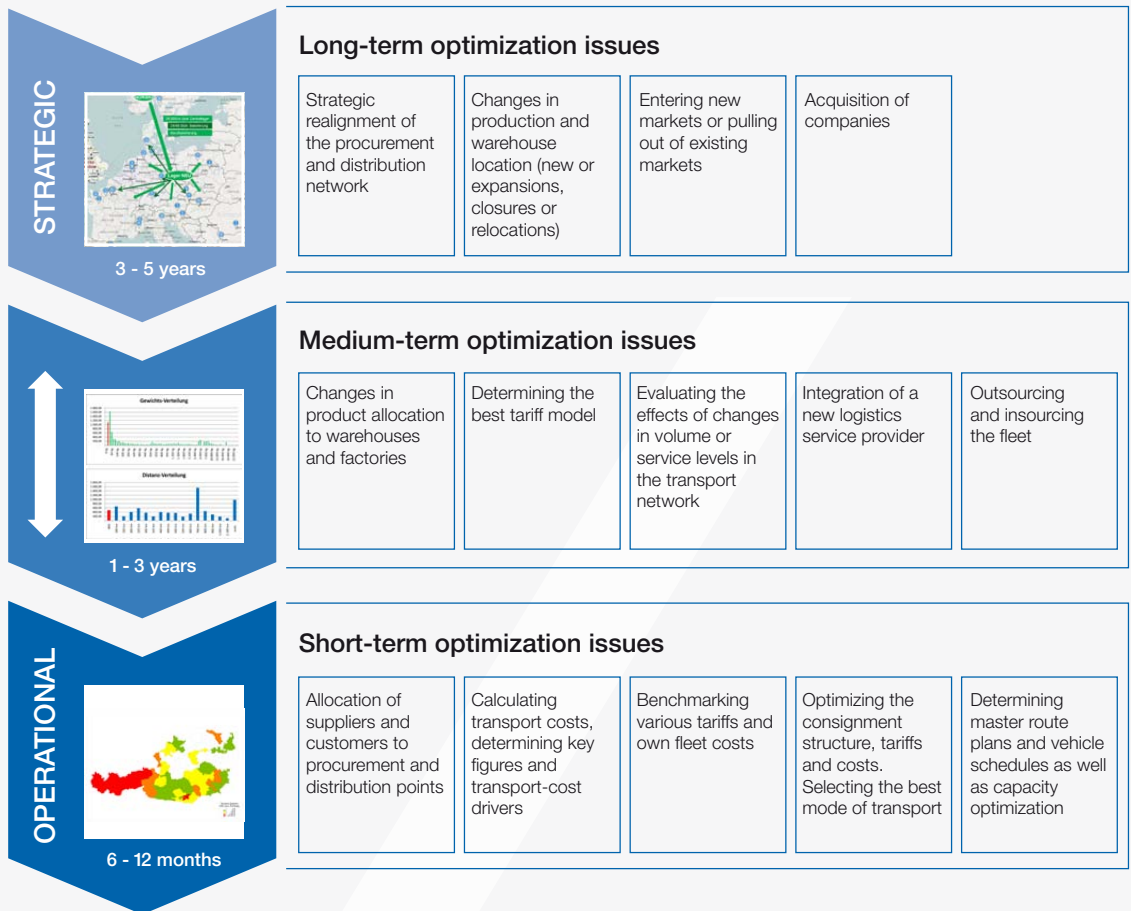

Use the right tools to quickly and simply reveal and utilize optimizing potential.

Your challenge

Transport networks which have grown organically but hardly been optimized? Advice on savings potential through benchmarks or comparisons with other companies? Continuous increase in logistics costs and stagnating transport tariffs? Large growth in volume, new locations, markets and customers? Trucks running at low capacity?

The solution

Against the background of cost and service optimization, as well as changing legal and organizational conditions, the complexity of transport networks is notably growing. One way of dealing with these requirements and the growing diversity is to review your transport network regularly and critically. By using the right tool for your optimization issues you can quickly realize latent potential.

Your benefit

- > Decisions can be quickly supported by quantitative facts (e.g. site relocations, fleet outsourcing)
- > Improving the transparency of the transport network (e.g. clarity about transport-cost drivers, creating a basis for negotiations with service providers, comparison of transport costs despite complex tariff types and calculation models)
- > Optimizing risk management (e.g. clarity about the effects of subtle cost increases or changes in service levels)
- > Initial savings after only a few weeks
- > Visualization of all results
- > Specific recommended action
- > Operational implementation of quantified savings
- > Access to tried and tested tools and years of experience
